

Abstract

The invention relates to a television system which typically includes a broadcast data receiver connected to or provided integrally with a television display screen. The system is provided with an internet capability and the invention allows the user of the capability to identify information relating to each of the internet page windows which are live and selectable for display across the screen at that instant by the generation of an information display which includes bibliographic data for each of the page windows. This therefore allows the system which hallows only one page window to be viewed at a time on the screen to be more user friendly.
